Escher's Relativity

Well-known by many as the painting to lose yourself in during a visit to the dentist, Relativity by M. C. Escher is one of the most famous uses of perspective and mathematical precision in the art world. The impossible construction of seven staircases, sixteen characters and a disdain for the normal laws of gravity was dismissed by the art world in the 50s but has since become acclaimed and its influence on pop culture can be felt from Labyrinth and Lemmings through to Daft Punk's Around the World..
